The objective of the volume is to explore if there is a consensus between the different methods, allowing us to better understand the nature of hominin dietary strategies through time. Contributions focus on modern studies, faunal studies, physical anthropology, archaeological studies, and isotopic studies, all aimed at answering the major questions of the evolution of hominid diets, such as: meat-eating emergence, hunting vs. scavenging, hunting technologies, and resource intensification in ...

The Diets of Early Hominins | Science

The evolution of the human diet *Homo sapiens sapiens*, the anatomically modern human, evolved from hominin ancestors over a period of approximately 3 million years during the Paleolithic Era. Anthropological evidence suggests that the majority of human evolution (approximately 2.5 of 3 million years) occurred in East Africa.

Diet has long been implicated as a driving force in human evolution. Changes in the type of food consumed and the manner in which it was procured have been linked with encephalization and the emergence of bipedalism, as well as ecological, social, and cultural evolution within the hominin lineage (1-3).

Isotopic evidence of early hominin diets

Diets with shifting environments from ~2.5 to 1.5 mya, *Homo* evolved in a context of habitat instability and fragmentation these contexts gave a selective advantage to traits, such as dietary flexibility that facilitated survival in shifting environments Body Size and Diet
